Title

Improving the water resistance of phenol-formaldehyde resin using biophenols obtained from liquid pyrolysis products of wood waste

Keywords: Phenol-formaldehyde resin . Resol resin . Wood pyrolysis . Pyrolysis liquid . Bio-oil . Phenol substitution .Biophenol . Water resistance coefficient

According to some researchers, about 35.5 million m3 of wood waste is generated annually in the Russian Federation.

These waste lignocellulosic biomass can serve as a source of energy and chemical components.

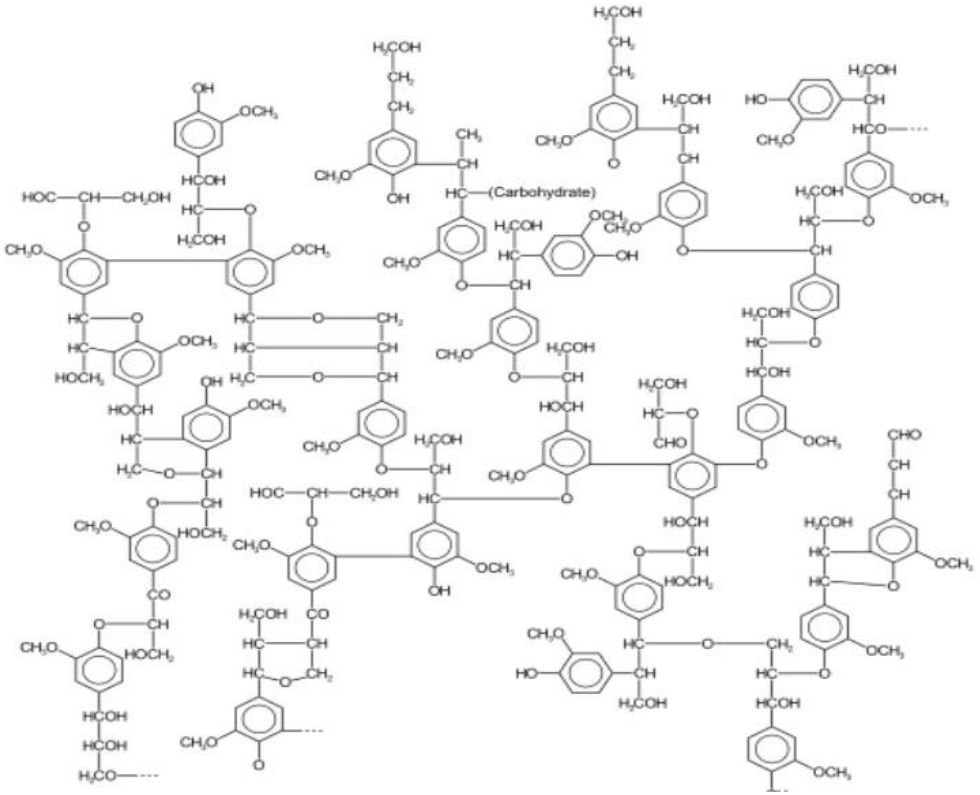
Keywords: Phenol-formaldehyde resin . Resol resin . Wood pyrolysis . Pyrolysis liquid . Bio-oil . Phenol substitution .Biophenol . Water resistance coefficient

Phenol in plants

An example of a possible structure of lignin



Phenolic compounds are produced by plants and microorganisms, and during growth they accumulate in cell vacuoles or polymerize into lignin.

Keywords: Phenol-formaldehyde resin . Resol resin . Wood pyrolysis . Pyrolysis liquid . Bio-oil . Phenol substitution .Biophenol . Water resistance coefficient

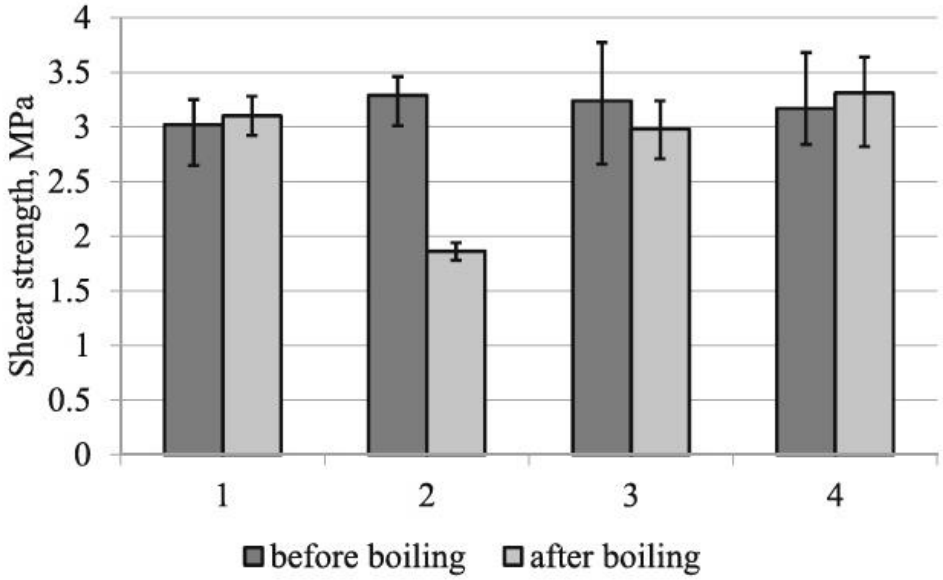
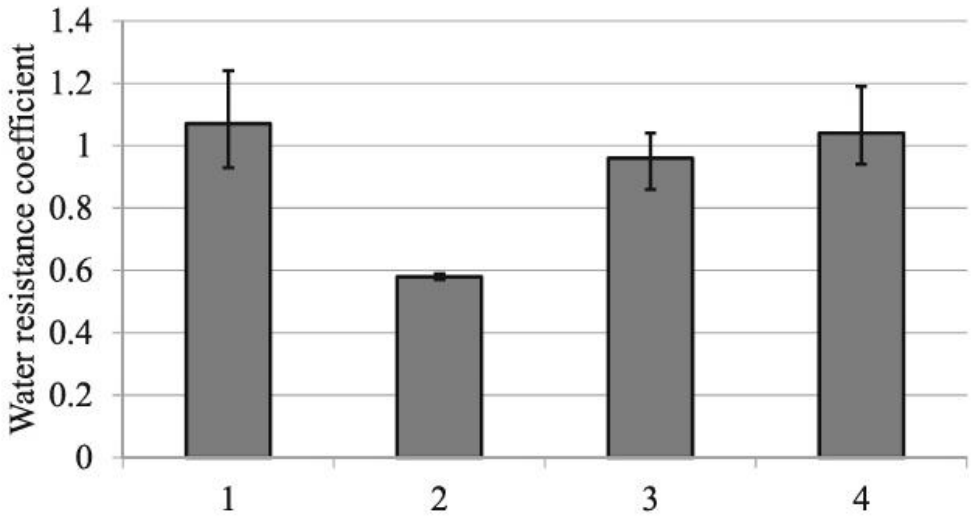
Shear strength before and after boiling and water resistance coefficients





1-control resin without PRF, 2-resin modified with PRF, 3- resin with PRF and cleaned with benzene, 4-resin with PRF and cleaned with hexane

Title

Improving the water resistance of phenol-formaldehyde resin using biophenols obtained from liquid pyrolysis products of wood waste

Keywords: Phenol-formaldehyde resin . Resol resin . Wood pyrolysis . Pyrolysis liquid . Bio-oil . Phenol substitution .Biophenol . Water resistance coefficient

Conclusions

- The results of the study indicate a significant influence of neutral substances in the composition of liquid products of rapid pyrolysis on the quality indicators of the resol phenol-formaldehyde resin.
- The release of neutral substances increased the water resistance coefficient for the resin with PRF purified hexane to 0.91 MPa, for the resin purified with benzene to 1.04 MPa.
- Benzene as an organic solvent copes more efficiently, the mass content of substances dissolved in benzene is 3.2%, in hexane 2.5%. The strength values of the resin purified with benzene remain stable before and after boiling (3.17 MPa before boiling, 3.31 MPa after boiling), and the water resistance coefficient is comparable to the water resistance coefficients of the control sample.
